

MICO-JDEQ Baseline Locked

Architecture of Control, Orchestration, Evidence, Audit, and Recovery

Core Principles

Use the cheapest, safest capability that meets the task.

L0 Authority & Cloud Strategy

Cloud is a capability provider, not the absolute authority.
The control plane remains strictly local on our verified nodes.

Central Authority dictates the mission, local field nodes execute, and concrete evidence is gathered before any promotion or output generation.

Device Roles

Z83 Gateway

Functions as the light control node. Focused strictly on state, registry, routing, and lightweight monitoring. Acts as the stable gatekeeper, running 24/7 without being overloaded.

PC-i5 Heavy Worker

Functions as the elastic local compute engine. Assigned to demanding tasks like heavy reasoning, RAG, and large OCR jobs when local privacy and capability outrank cloud offloading.

Intelligent Storage Orchestration

40

Cloud Storage Accounts

A Virtualized Approach

Rclone mounts are virtual access points, not true local disks. We utilize a rotation pool strategy to manage 40 cloud accounts seamlessly.

By mounting only what is strictly necessary, we conserve precious RAM, minimize API token refreshes, and maintain extreme efficiency on small edge devices.

Kanban Wrapper Invariant

- ✓ **One Card** = One clear, isolated objective.
 - 🎯 **One Objective** = One definitive result.
 - 📄 **One Result** = One unbreakable evidence chain.
 - ⏪ **One Failure** = One secure recovery path.
-

Resource-First Execution

Justify Workloads

No AI model is assigned without rigorous hardware and resource margin verification.

Separate Storage

Cloud storage is strictly isolated from core compute and control plane capabilities.

Validate Hardware

Repurposed equipment is used strictly for power, signal, or sensors based on physics.

Node Capability Matrix

Target Node	Designated Role	Primary Workload	Network Layer
PC-i5 (Windows/WSL)	Heavy Local Worker	Local AI / RAG / OCR	Tailscale / LAN
Z83 (Linux)	Gateway / Control	State / Registry / Cron	Tailscale / LAN (24/7)
Vivo / Infinix	Mobile Interface	Control / Alerts / API	Tailscale / WiFi
Cloud Services	Capability Provider	Heavy Compute / Archiving	External API / Mount

Local AI Policy

Evidence Before Promotion

Every node within the ecosystem must be thoroughly evaluated for its local AI capability. Hardware margins, thermal limits, and objective benchmarks dictate deployment.

We promote tools and models based on factual runtime evidence, not industry slogans. If a node cannot handle a task safely, it is blocked or offloaded.

Baseline Ready

Aeterna Self-Audit Complete. Ready for Execution.
